SERVICE STATION 360

Premium Coworking & Shared Office Platform

Nethmini Jayasinha

Task 1: Requirements Analysis & User Stories

1. Service Station 360
2.

A. US01-secure member access

As a member , I want to register and sign in securely , so that I can access services associated with my account.

- Given valid registration details, when I submit the form, then the system creates one member account and confirms successful registration.
- Given an existing account, when I enter valid credentials, then I am signed in and taken to my member home page.
- Given invalid credentials, when I attempt to sign in, then access is denied and a clear, non-revealing error message is displayed.

B. US02 - Manage member profile

As a member, I want to view and update my profile, so that my contact and account details remain accurate.

- Given I am signed in, when I open My Profile, then the system displays the profile fields I am authorized to view.
- When I update an editable field with valid data and save, then the new value is stored and displayed.
- When a required field is missing or invalid, then the system identifies the field and does not save the invalid changes.

C. US03 - Find available desks

As a member, I want to search desks by location and date, so that I can find a suitable workspace before arriving.

- Given a location and date, when I search, then the system displays desks available for the requested period.
- Desks already reserved, unavailable or blocked by staff are not presented as bookable.
- When no desks match, then the system displays a clear no-availability message and allows me to change the search.

D. US04 - Reserve a desk

As a member, I want to reserve an available desk, so that I have a confirmed place to work.

- Given a desk is available, when I confirm a valid reservation, then the system creates a booking with a unique reference.
- When two members attempt to reserve the same desk for overlapping periods, then only one reservation is confirmed.
- After confirmation, the desk is shown as unavailable for the reserved period and the member receives confirmation.

E. US05 - View meeting-room availability

As a member, I want to view meeting rooms by capacity, facilities and time, so that I can choose a room that fits my meeting.

- Given a date, time and optional capacity/facility filters, when I search, then matching available rooms are displayed.
- The result shows each room's capacity and configured facilities alongside its available time slots.
- Rooms with confirmed overlapping bookings or operational blocks cannot be selected for that time.

F. US06 - Book a meeting room without conflicts

As a member, I want to book an available meeting room, so that my team has a confirmed space.

- Given a room is available for the full requested period, when I submit a valid booking, then the system confirms it and generates a booking reference.
- If another booking has already claimed any overlapping part of the requested period, then the system rejects the conflicting booking and refreshes availability.
- A confirmed booking records the room, organizer, start/end time, attendee count and status.

G. US07 - Amend or cancel a booking

As a member, I want to change or cancel my booking, so that I can respond to changes in my plans.

- Given a booking is eligible for amendment, when I change its time or resource and save, then the system validates availability before confirming the change.
- When I cancel an eligible booking, then its status changes to Cancelled and the resource is released according to the approved cancellation policy.
- The member receives a notification showing the outcome; any applicable fee or refund is calculated using the approved policy.

H. US08 - View upcoming bookings

As a member, I want to see my upcoming and past bookings, so that I can manage my workspace activity.

- When I open My Bookings, then I can see bookings associated with my account, ordered by date.
- Each booking displays its resource, location, date, time, status and reference.
- Cancelled and completed bookings remain identifiable and are not presented as active reservations.

I. US09 -Check in to a booking

As a member, I want to check in when I arrive, so that staff can see that I am using my reserved space.

- Given I have a valid booking, when I complete the approved check-in action, then the system records the member, booking, resource and check-in timestamp.
- A check-in is accepted only for the correct member and eligible booking within the configured check-in window.
- After successful check-in, the booking and operational occupancy view show the member as checked in.

J. US10 - Browse catering options

As a member, I want to browse catering items and service options, so that I can select refreshments for my team.

- When I open Catering, then the system displays currently orderable items with descriptions and prices.
- Unavailable items are clearly marked and cannot be added to a new order.
- The displayed options reflect the selected location and any configured service availability.

K. US11 - Submit a catering order

As a member, I want to submit a catering order for a meeting, so that refreshments are delivered to the correct place and time.

- Given valid items, quantities, delivery details and a permitted delivery time, when I submit the order, then the system creates an order with a unique reference.
- The order is linked to the member and, where applicable, the meeting-room booking.
- Before submission, the system displays an order summary including quantities, requested delivery time, delivery location and total price.

L. US12 - Track catering order status

As a member, I want to track my catering order, so that I know whether it has been received and prepared.

- When I view an order, then its current status and reference are displayed.
- When authorised staff update the order status, then the member can see the latest status without submitting a duplicate order.
- If an order is rejected or delayed, then the member is informed with the reason or next step where available.

M. US13 - Manage catering fulfilment

As a catering staff member, I want to view and update incoming orders, so that no corporate order is missed or delayed without visibility.

- The staff view lists new and active orders with reference, items, quantities, delivery time and destination.

- Authorised staff can move an order through the agreed statuses, and each change records who made it and when.
- Overdue or at-risk orders are visually distinguishable from orders that are on track.

N. US14 - View live building occupancy
   As a Community Manager, I want to see current building occupancy, so that I can understand how busy the location is.
   - The dashboard displays the latest known occupied and available desk/room counts for the selected location.
   - Occupancy is calculated from the agreed operational statuses and excludes cancelled or expired bookings.
   - The dashboard displays the time of its last successful refresh so staff can judge data freshness.

O. US15 - See room-level occupancy
   As a Community Manager, I want to see who is assigned to each meeting room, so that I can answer queries and identify room-use issues.
   - For each room, the dashboard displays its current status and the relevant booking/organiser information permitted by the access policy.
   - A room changes to occupied after a valid check-in and changes to available after the agreed end/checkout process.
   - The dashboard distinguishes booked-but-not-checked-in rooms from rooms confirmed as occupied.

P. US16 - Monitor arrivals and departures
   As a Community Manager, I want to see member check-ins and check-outs, so that I can understand who is currently on site.
   - The staff view lists check-in/out events with member, location, resource and timestamp, subject to role permissions.
   - A member's current presence status is derived from the approved check-in/check-out rules.
   - Staff can identify records with missing or inconsistent checkout information for follow-up.

Q. US17 - Receive booking and order notifications
   As a member, I want timely notifications about booking and catering events, so that I do not miss important changes.
   - The system sends a confirmation after a booking or catering order is successfully created.
   - The system notifies the member when a booking or order is changed, cancelled, delayed or otherwise requires their attention.
   - A notification failure does not create a duplicate booking/order; the event remains visible in the member account.

R. US18 - Manage workspace resources

As an authorised administrator, I want to maintain desks, rooms, capacities and facilities, so that the platform reflects the actual site.

- An authorised administrator can create, edit, deactivate or block a resource.
- A resource cannot be deleted or deactivated in a way that silently removes the history of existing bookings.
- Changes to resource availability are reflected in member search results and staff views.

S. US19 - Control staff access
As a system administrator, I want to assign role-based permissions, so that staff can access only the functions needed for their duties.

- An administrator can assign approved roles such as Community Manager, Catering Staff and Administrator.
- Users can perform only the actions permitted for their assigned role.
- Access-denied attempts are handled safely and relevant security events are logged.

T. US20 - Review operational activity
As an Operations Manager, I want to review booking, occupancy and catering activity, so that I can identify recurring service problems and improve operations.

- The report provides date and location filters for the agreed operational measures.
- Reported totals reconcile to the underlying booking statuses and clearly define each measure.
- Only authorised roles can access or export operational reports, and the report shows its selected period and generation time.

Task 2: Handling Scope Change & Non-Technical Clients

I would treat the Operations Director's request as a proposed change to the agreed project scope. I would not promise immediate delivery or allow the development team to start implementation before assessing its impact. First, I would discuss the request with the Project Manager and evaluate whether the additional functionality can be delivered within the existing timeline, budget and resources. I would then follow the change-control process to ensure that the request is properly analysed, approved and prioritised.

Capture the requirement accurately: Record the requested trigger (booking start), the 15-minute grace period, the smart-door scan evidence, automatic cancellation, release of the room and the $10 penalty. Confirm the intended outcome and the business reason: reducing rooms blocked by members who do not arrive.

Ask targeted clarification questions: Confirm what counts as a valid scan; whether the scan must be by the organiser or any authorised attendee; whether the scan must be at the booked room door; how late arrivals are handled; what happens if the door system is offline; whether there are exemptions; how the fee is collected; and how disputes/refunds are managed.

Assess impact with technical specialists: Arrange a short technical discovery with the solution architect/developer and smart-door/vendor representative. Check API/event availability, device identity, authentication, event timestamps, network reliability, vendor costs, test hardware/sandbox, security and personal-data implications.

Update requirements and traceability: Create a change request and a new/updated user story with testable acceptance criteria. Link it to affected booking, availability, notification, payment and audit requirements. Record open questions and assumptions rather than hiding them.

Work with the Project Manager: Share the impact assessment and options: include in current release with an agreed trade-off, deliver in a later phase, or deliver a manual interim process. Ask the PM to assess schedule, cost, resources, dependencies and risks, then obtain the required client approval.

Agree priority and scope baseline: Use a change-control decision with the authorised sponsor. Update backlog priority, release plan, estimates, risks, dependencies and stakeholder communications only after approval.

Prepare for validation: Define integration test cases, door-event failure cases, timezone handling, penalty calculations, cancellation timing, room release and audit evidence. Ensure UAT includes the Operations Director's scenarios.

Key clarification questions before approval

- Is this functionality required for the first release?
- Does the 15-minute window end exactly 15 minutes after the booking start, and is a scan at that exact instant accepted?
- Can any attendee assigned to the booking check in, or only the organiser?
- Must the scan occur at the exact booked room door, and how is the correct room identified?
- What is the fallback if the smart-door service, internet connection or device is unavailable?
- Are there approved exemptions (for example, a staff-authorised extension or accessibility-related exception)?
- Is the $10 penalty charged in USD, and is it charged once per booking or per member?
- What happens if payment fails, the member disputes the charge, or the booking is later found to have had a valid scan?

- How quickly must the room become available again, and should members already searching see it immediately?

2.

Subject: Assessment of the proposed smart-door and no-show booking rule

Dear Operations Director,

Thank you for highlighting the no-show issue. I understand the business objective: if a member does not arrive for a meeting-room booking, the room should not remain unavailable to everyone else, and the policy should discourage bookings that are not used.

The proposed rule can support that objective. However, it adds more than a change to the booking screen. The application would need to receive reliable check-in information from the physical door, match that information to the correct member, room and booking, wait for the agreed 15-minute period, and then decide whether to release the room and apply the $10 charge.

This means we need to connect the application to the door supplier's system and confirm that the doors can provide the required information reliably. We also need to agree what happens if a door or internet connection is unavailable, if an attendee arrives instead of the organiser, or if a member disputes a charge. These safeguards are important so that a genuine arrival is not mistaken for a no-show and a member is not charged incorrectly.

Because this was raised after the initial requirements were agreed, it may affect the delivery date and project cost. The size of the impact depends on the door supplier's integration options, any additional licences or equipment, the work needed to connect and test the systems, and the number of exceptions we must support. I do not want to give you an unreliable time or cost estimate before the technical team has checked these points.

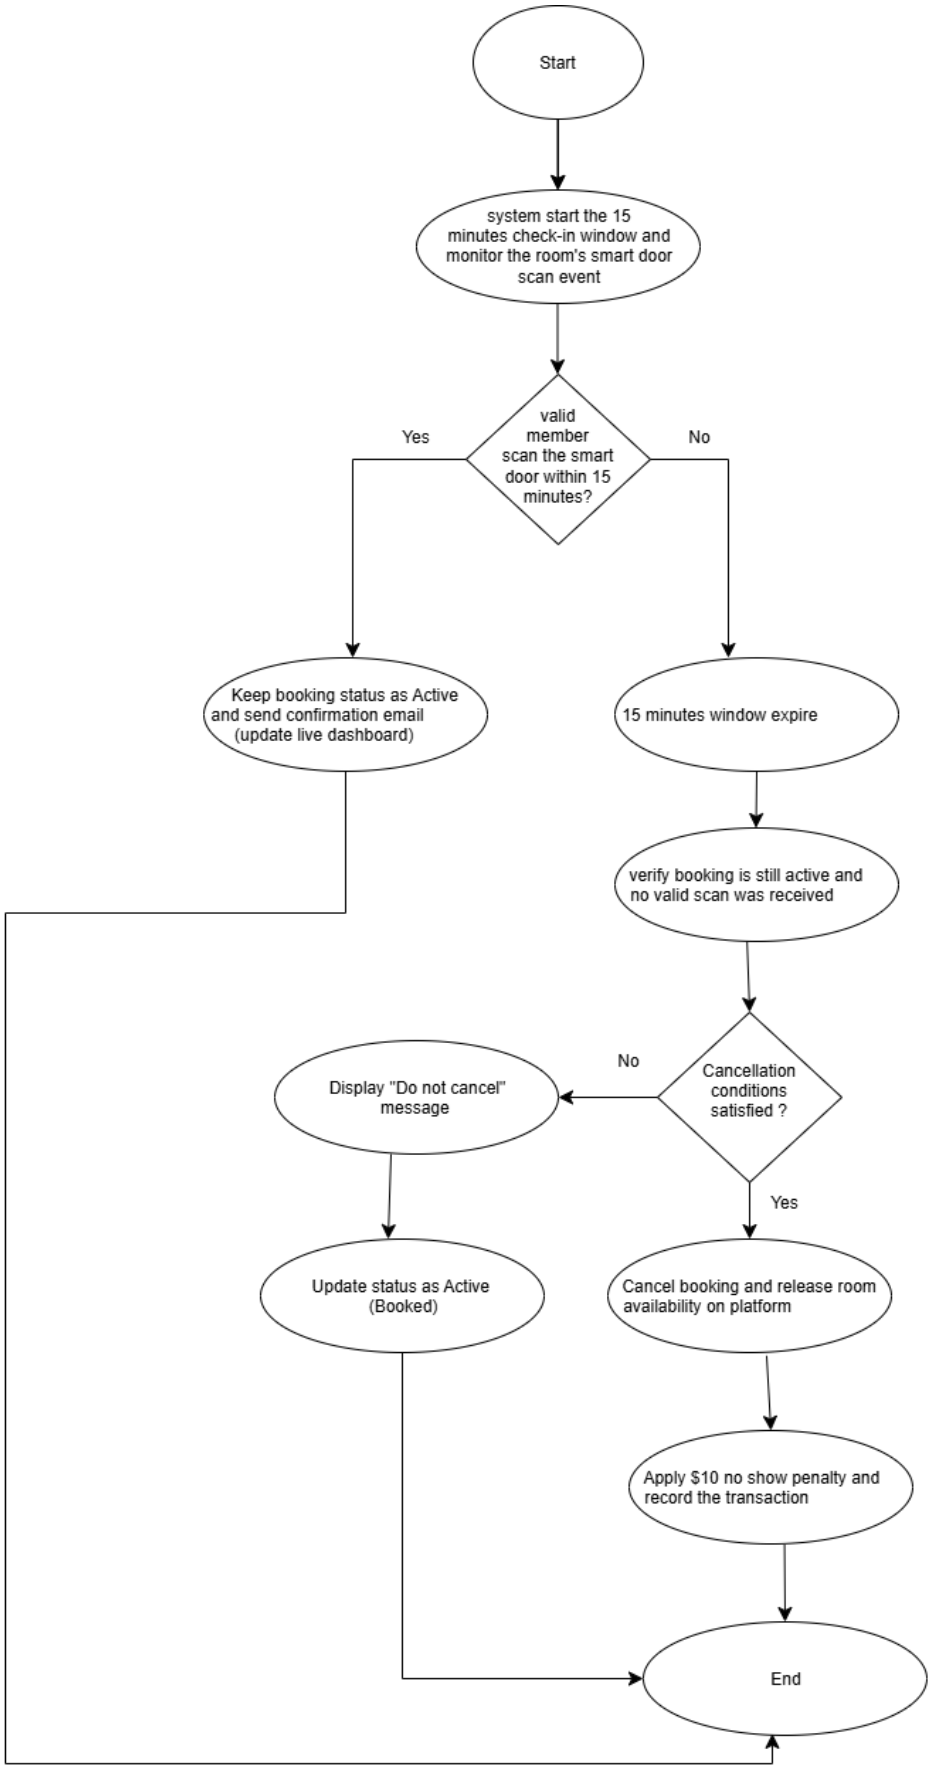

My recommendation is that we run a short technical assessment with the development team and door-system supplier, while I confirm the operational rules with you. We will then provide the Project Manager with the estimated effort, cost, schedule impact and any delivery options. You can decide whether this should be included in the current release, prioritised by moving another feature, or delivered in a later phase.

We will keep the original agreed work visible and will not change the delivery commitment until the impact and the revised scope have been reviewed and approved.

Kind regards,

Nethmini Jayasinha
(Business Analyst)

3.

Start
system start the 15 minutes check-in window and monitor the room's smart door scan event
valid member scan the smart door within 15 minutes?
Yes
No
Keep booking status as Active and send confirmation email (update live dashboard)
15 minutes window expire
verify booking is still active and no valid scan was received
Cancellation conditions satisfied ?
No
Yes
Display "Do not cancel" message
Update status as Active (Booked)
Cancel booking and release room availability on platform
Apply $10 no show penalty and record the transaction
End

Task 3: Client Meetings & Requirement Gathering

1.

Time	Topic	Expected result
0 -3 min	Welcome, introductions and meeting objective	Confirm the purpose: define what the Community Manager needs to see and do on the live dashboard.
3-8 min	Current front-desk workflow and weaknesses	Understand how occupancy, room use and catering are currently tracked; identify delays and workarounds.
8-17 min	Dashboard information and business rules	Explore occupancy definitions, room/member details, order statuses, filters, alerts and role permissions.
17-24 min	Scenarios, exceptions and priorities	Walk through busy periods, late arrivals, room changes, delayed catering and inaccurate/stale data.
24-28 min	Review proposed requirements and priorities	Summarise must-have items, later enhancements, assumptions and unresolved questions.
28-30 min	Confirm actions and next steps	Agree owners, follow-up information, requirement sign-off approach and next checkpoint.

2.

- When you say “real-time occupancy”, what exactly should count as occupied: a confirmed booking, a successful check-in, or a person physically detected inside the building?
- Which system or event should be treated as the authoritative source for desk and room status, and what should staff do if two sources disagree?
- How quickly must a booking, check-in or room-status change appear on the dashboard for it to be useful during a busy shift?
- What headline numbers do you need at a glance for example, total capacity, occupied desks, available desks, occupied rooms and rooms awaiting check-in?
- For each meeting room, what information is genuinely needed: room name, organiser, booking time, attendee count, check-in status, facilities or contact details? Which details should be hidden for privacy?

- Which order statuses should appear as “pending”, and what makes an order urgent or at risk for example, delivery due soon, not yet accepted, or preparation delayed?
- Should the dashboard be view-only, or must staff be able to open a booking, contact a member, update an order, record an exception or release a room from the same screen?
- How do you want to filter the dashboard: by location, floor, room, date/time, booking status, catering status or service team? Which filters are essential during a shift?
- Which situations require a visible alert or notification, and who should receive it for example, an overdue catering order, a room not checked into, a door-system outage or conflicting occupancy data?
- Who will use this dashboard and what should each role be allowed to see or change? How will you measure whether it has improved front-desk operations?

Task 4: User Acceptance Testing (UAT) & Defect Reporting

I would keep the discussion factual and collaborative. I would not argue about whose machine is correct; I would show the same booking record, the stored UTC value and the expected display under the agreed business timezone.

What I would say: “Thanks for checking it locally. The fact that it displays correctly in your environment is useful, but UAT has exposed a difference in the client's environment. We need the booking to display correctly for the agreed location and user time zone, not only on one machine. Let's reproduce it with the same booking data and compare the stored UTC timestamp with the dashboard's displayed value. We can then identify whether the issue is in conversion, timezone configuration or display logic.”

Investigation steps

1. Reproduce the defect using the same member, booking, room, start time and user roles used in UAT. Capture screenshots and the exact test environment.
2. Confirm the business rule: should the dashboard show the coworking location's local time, the logged-in staff member's time zone, or both? For a front-desk operational dashboard, the location's time zone is usually the clearest default, but the client must approve it.
3. Inspect the saved value and format. Confirm that the timestamp represents the intended instant in UTC and that no conversion has already occurred before storage.
4. Check the dashboard's display layer, API response, browser settings, server settings and configured location timezone. Identify whether a UTC value is being displayed as if it were local time, or converted twice.

5. Test daylight-saving transitions and representative users in different time zones. Do not hard-code a fixed offset; use a named time zone such as America/New_York for New York and the configured IANA zone for the coworking location.
6. Compare web and mobile behaviour and verify booking creation, editing, cancellation, notifications, calendar views and reports use consistent time rules.
7. Retest the fix in the shared test/UAT environment, obtain client confirmation, and run regression tests for bookings near midnight and daylight-saving changes.
8. Document root cause, affected records, fix version, test evidence and closure approval in the defect tracker.

2.

Issue Type	Bug
Title	[UAT][Critical] Meeting-room booking displays an incorrect time on the Community Manager dashboard for cross-time-zone bookings
Priority / Severity	Priority: Highest (proposed). Severity: Critical to booking operations because incorrect schedule display can contribute to room conflicts and missed meetings. Confirm final classification with the project team.
Environment	UAT environment; web portal; Community Manager dashboard; member account based in New York. Record browser, OS, application build and configured coworking-location timezone during reproduction.
Preconditions	A meeting room is available. A member account is configured for New York. The Community Manager account is configured for the coworking location. The location's authoritative timezone is known and documented.
Test Data	Create a meeting-room booking for 9:00 AM New York time on a date when the applicable New York offset is EST (UTC−05:00). Example: 9:00 AM EST corresponds to 14:00 UTC. Expected

	dashboard display must be calculated using the confirmed coworking-location timezone.
Steps to Reproduce	1. Sign in as a member whose time zone is set to New York. 2. Select an available meeting room. 3. Create a booking for 9:00 AM New York local time on the selected EST date. 4. Save the booking and note its booking reference. 5. Sign in as the Community Manager. 6. Open the room schedule/dashboard for the same date and location. 7. Locate the booking and compare its displayed time with the expected location-local time and the stored UTC timestamp.
Expected Result	The dashboard displays the booking at the correct time in the agreed coworking-location timezone (or in the explicitly approved viewer timezone). The displayed value represents the same instant as the member's 9:00 AM New York booking. No booking is shifted, duplicated or placed in the wrong slot.
Actual Result	The Community Manager dashboard displays the booking at 2:00 PM, which does not match the expected time identified for the configured location. UAT indicates that the booking is saved in UTC but the dashboard does not correctly convert it for display.
Business Impact	Community Managers may see an incorrect room schedule, misunderstand when a room is reserved and make operational decisions based on the wrong time. This can lead to apparent or actual scheduling conflicts, poor member experience and loss of trust in the platform.

Attachments / Evidence	Attach: member booking confirmation screenshot; Community Manager dashboard screenshot; booking reference; raw UTC timestamp/API response; member and staff timezone settings; test date; browser/OS; application build.
Suggested Investigation Area	Review timezone conversion in API-to-dashboard flow, location/user timezone configuration, date parsing and formatting, and any double-conversion or missing-conversion logic. Do not assume the developer's local machine is representative of UAT.
Acceptance Criteria for Fix	1. The same booking instant is shown correctly in the approved timezone on web and mobile. 2. Tests cover at least two different user time zones and daylight-saving boundary dates. 3. Booking creation, edit, cancellation and notifications remain consistent. 4. UAT tester confirms the corrected display against an independently calculated expected value.
